

Level 1 - Java Programs

This document contains four basic Java programs demonstrating arrays, loops, conditions, and input handling.

Program 1

Program 1: Voting Eligibility Checker

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int[] age = new int[10];

        for(int i = 0; i < 10; i++){
            age[i] = sc.nextInt();
        }

        for(int i = 0; i < 10; i++){
            if(age[i] >= 18){
                System.out.println("The student with the age " + age[i] + " can vote");
            }
            else if(age[i] < 0){
                System.out.println("an invalid age");
            }
            else{
                System.out.println("The student with the age " + age[i] + " cannot vote");
            }
        }
    }
}
```

Program 2

Program 2: Number Classification and Array Comparison

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int[] num = new int[5];

        for(int i = 0; i < 5; i++){
            num[i] = sc.nextInt();
        }

        for(int i : num){
            if(i > 0 && i % 2 == 1){
                System.out.println(i + " is odd positive number");
            }
            else if(i > 0 && i % 2 == 0){
                System.out.println(i + " is even positive number");
            }
            else if(i < 0){
                System.out.println(i + " is negative number");
            }
            else{
                System.out.println("zero");
            }
        }

        if(num[0] > num[4]){
            System.out.println("first element is greater than last element of the array");
        }
        else if(num[0] == num[4]){
            System.out.println("first element is equal to last element of the array");
        }
    }
}
```

```

    }
    else{
        System.out.println("last element is greater than first element of the array");
    }
}
}

```

Program 3

Program 3: Multiplication Table Using Array

```

import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int mul = sc.nextInt();
        int[] arr = new int[10];

        for(int i = 1; i <= 10; i++){
            arr[i-1] = mul * i;
        }

        for(int i = 1; i <= 10; i++){
            System.out.println(mul + "*" + i + "=" + arr[i-1]);
        }
    }
}

```

Program 4

Program 4: Input Until Condition and Sum Calculation

```

import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int[] num = new int[10];
        int index = 0, sum = 0;

        while(true){
            num[index] = sc.nextInt();
            sum += num[index];

            if(num[index] < 1 || index == 9){
                break;
            }
            index++;
        }

        for(int i = 0; i < index; i++){
            System.out.println(num[i]);
        }

        System.out.println(sum);
    }
}

```
